Libuna_Sabordo_Sambajon

Project Changelog: Version 2.0

Documenting changes from Iteration 1 to Iteration 2:

- **Added:** GitHub repository integration for group version control and collaborative development.
- **Added:** React Context API (UserContext.js) for global session management, allowing user data to be accessible across all app screens.
- **Added:** `AsyncStorage` for persistent login states, enabling auto-login and session memory even after the app is closed.
- **Added:** Inline form validation on the Login screen to prevent empty or invalid email/password submissions.
- **Added:** Empty state UI for the News and Report tabs to improve user experience when no data is present.
- **Added:** Local Location History feature in the Profile tab, saving movement logs directly to the device's storage for resident privacy.
- **Changed:** Refactored `App.js` to simplify navigation logic and moved all UI elements into organized subfolders within the `/components/screens` directory.
- **Fixed:** Resolved a UI glitch where tab icons would overlap on certain Android screen resolutions by implementing `Platform.OS` specific styling.
